Traklogg - an Automatic Mileage Recording Solution

About Traklogg

Traklogg is an Automatic Mileage Recording Solution that enables users to track and manage mileage information for reimbursement, reporting and tax purposes.

It is developed to easily track and report on the vehicle mileage of anyone who uses his or her vehicle to make a living. Real estate agents, small business owners and others who have traditionally kept track of mileage manually use the Traklogg solution to track, manage and protect their mileage data.

The Traklogg Solution combines three distinct components (the Traklogg device itself, the Traklogg Dashboard Manager and Traklogg MyTrips) that allow users to quickly and effortlessly create detailed mileage reports.

By connecting the device to a PC, the mileage data is loaded into the intrinsic Traklogg Dashboard Manager. This software, which users install on their computers, creates customized reports based on mileage and start/stop times, calculates mileage reimbursement totals and displays trips via Google Earth.

The Traklogg Solution also includes a secure, password-protected portion of the Traklogg Website called Traklogg MyTrips. Traklogg MyTrips enhances the user experience by providing real-time address conversion, the ability to store and backup mileage reports and anytime access via an Internet connection.

Business Need

Traklogg solution has three different parts, out of which the device was found by the client himself.

There was a need of Dashboard Manager which could be a downloadable customized software application users could install on their PC or laptop that enable them to easily manage and organize their mileage data. With the single click of a button could download and store their mileage information securely and privately on their laptop or desktop computer, review their mileage information and create, print or share mileage reports.

There was a also a need of an online subscription-based service that could enhance Traklogg Dashboard Manager by translating users' start and stop destinations into physical addresses, providing storage and protection of valuable mileage information and allowing access to their mileage records from anywhere with internet access.

Features

- Dashboard Manager
